Grow Program: Mum Stock Plants

Supplemental Spray Recommendation

Current Feed / Water Program: Continue with your current feed program.

A weekly application of Nature's Source Foliar Essentials encourages additional breaks and a toned growth habit, while enhancing nutrient uptake. Apply at a rate of 1 gallon per 100 gallons of water (1 oz. per gallon). Apply every 5-7 days as needed.

Nature's Source Benefits: Nature's Source is derived from oilseed extract, providing a low salt index. Mums grown with Nature's Source Foliar Essentials will have deeper green foliage and more pliable stems – increasing cutting with tone and reduced salt stress as is often the case when grown with salt based synthetic fertilizers.

Injector Ratio Chart

Ounces to make 1 gallon of stock solution

Injector Setting	½ Rate Oz.	Full Rate (Optimum) Oz.
1:15	10	20
1:50	32	64
1:100	64	

Tank Mixing Rates:

Greenhouse Application:

• 64 oz. to 128 oz. (1 gallon) per 100 gallon tank

Field Application:

• 1 to 5 gallons per acre

Aerial Application:

16 oz. to 32 oz. per acre in minimum of 10 gallons of water

Stock tank solutions are not recommended. When stock tank is mixed, Solution should be kept fresh and covered. To be used within 48-72 hours. Sanitize with an organic sanitizing spray on top of solution if held longer than 72 hours.

ALWAYS AGITATE THE PLANT FOOD BEFORE ADDING OT STOCK TANK ALWAYS AGITATE THE DILUTION PRIOR TO EACH USE

Nature's Source is made with oilseed extract which contains 20 plant-essential amino acids, silicon, and organic compounds (see reverse).

Note: This program assumes soil media, water source and climate control is ideal. Adjustments will also be necessary based upon a strain's growth habit and actual flower timing

- Soil Media Use only well drained professional soil media products with a small organic nutrient or compost component with a beginning EC under 1.5 mS/cm
- Water Source Treat high alkalinity water, (above 100 ppm), with acid neutralization for a stabile water pH of 6.5. High EC water, above .5 mS/cm, will require regular EC monitoring and possible remediation through leaching and/or water treatment.

Strain Adjustment – Plan to reduce or eliminate the high rates in Vegetative Stage 2 for dwarf and early flowering strains; some strains may need reduction to half the recommended rate of Nature's Source Foliar Essentials

Oilseed Extract: Key Organic Compounds

Includes 20 Plant Essential Amino Acids, Essential Vitamins, Hormones and Minerals*

AMINO ACIDS	Role**
Alanine	Only amino acid that can operate in anaerobic and N-limiting conditions. Helps plants deal with flood and N-limiting conditions
Arginine	Amino acid in plants that acts as an important nitrogen reserve and recycling, but also as a precursor of the biosynthesis of polyamines, nitric oxide and so on. Polyamines and nitric oxide are important messengers involved in almost all physiological and biochemical processes, growth & development, and adaptation of plants to stress (http://www.ncbi.nlm.nih.gov/pubmed/17287563)
Asparagine	Affects nitrogen transport and storage efficiency
Aspartic Acid	Significantly improves nutrient acquisition by the plant through artificially increasing the volume of phosphorus fertilizer occupie by increasing root branching and root hair development. (https://docs.google.com/viewer?url=patentimages.storage.googleapis.com/pdfs/US5350735.pdf)
Cysteine	Can increase H2S production in soil. An important negative effect of H2S on plant growth is an inhibition of the energy dependent process of N uptake. (https://wap.aslo.org/lo/toc/vol_35/issue_2/0399.pdf)
Glutamic Acid	Fundamental metabolite in the formation of vegetable tissue and chlorophyll synthesis. Fundamental to plant growth.
Glutamine	Builds key enzyme involved in assimilating inorganic nitrogen
Glycine	Plant growth regulator to slow the maturation process of some fruit by temporarily suppressing ethylene production. Slows fru ripening in some plants.
Histidine	Supplying histidine to a non-accumulating species greatly increases both its nickel tolerance and capacity for nickel transport t the shoot. (http://www.nature.com/nature/journal/v379/n6566/abs/379635a0.html)
Isoleucine	Critical for protein synthesis and normal plant growth, while also providing precursors for a number of secondary metabolite such as; cyanogenic glycosides, glucosinolates, and acyl-sugars.
Leucine	Involved in plant defense and resistance to pathogens.
Lysine	Impacts gene expression; regulates flowering time and hormone response.
Methionine	L-methionine is an established precursor of ethylene and its application to soil has shown positive effect on plant growth. Ha
	also been shown to increase C2H4 accumulation in the soil atmosphere. (http://www.pakbs.org/pjbot/PDFs/41(5)/PJB41(5)2455.pdf)
Phenylalanine	Starting compound used in the flavonoid biosynthesis. Key component to antioxidant production, may improve flavors.
Proline	Protects membranes and proteins against the adverse effects of high concentrations of inorganic ions and temperature extreme Increases plants ability to deal with temperature stress.
Serine	Fundamental role in metabolism, linked to root development.
Threonine	Protein kinases frequently attach phosphates to Threonines in order to facilitate the signal transduction process. Helps uptake phosphates.
Tryptophan	Can increase IAA concentrations in soil. IAA can increase internodal elongation.
Tyrosine	Important role in photosynthesis, electron donor in chloroplasts
Valine	Essential amino acid for plant growth
Valific	Essential arrinto della for piant growth
OTHER ORGANIC COMP	
	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damag
Vitamin C	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damag resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and hel deal with stress.
Vitamin C Vitamin D3	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damag resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and hel deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and prevent
Vitamin C Vitamin D3 Alpha-Tocopherol	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and heldeal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and 0H), and preventhe propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed through
Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1)	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and held deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 1O2 and OH), and prevent the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed throughigh salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrier solution. (http://www.quickgrow.com/gardening_articles/plant_hormones.html) Induced expression of pathogenesis-related (PR) genes in the plants, suggesting its ability to trigger a signal transduction pathway that leads to systemic resistance.
Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1) Riboflavin (B2)	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damage resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and held deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 1O2 and OH), and prevent the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed throughigh salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrier solution. (http://www.quickgrow.com/gardening_articles/plant_hormones.html) Induced expression of pathogenesis-related (PR) genes in the plants, suggesting its ability to trigger a signal transduction pathway that leads to systemic resistance. (http://apsjournals.apsnet.org/doi/abs/10.1094/PHYTO.2000.90.8.801)
Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1) Riboflavin (B2) Phenols	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damag resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and hel deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 1O2 and OH), and prevent the propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed throug high salinity, pathogens such as pythium, nutrient deficiencies and toxicities. Rapidly broken down by microbes in the nutrier solution. (http://www.quickgrow.com/gardening_articles/plant_hormones.html) Induced expression of pathogenesis-related (PR) genes in the plants, suggesting its ability to trigger a signal transduction pathway that leads to systemic resistance. (http://apsjournals.apsnet.org/doi/abs/10.1094/PHYTO.2000.90.8.801) Released from decomposing plant litter, can be transformed into insoluble and recalcitrant humic substances, form chelates with aluminum or iron ions (immobilizes metals). Can lock up heavy metals within the soil, making them immobile. Silica is the 2nd most abundant element in the soil and effectively reduces susceptibility of plants to pest
Vitamin C Vitamin D3 Alpha-Tocopherol Thiamine (B1) Riboflavin (B2) Phenols Silica (SiO2)	Antioxidant and, in association with other components of the antioxidant system, protects plants against oxidative damag resulting from aerobic metabolism, photosynthesis and a range of pollutants. All vitamins are essential to plant growth and hel deal with stress. Affects Ca absorption and Ca-mediated cellular functions (signaling). Ca helps hold cell membranes together. Natural vitamin E, antioxidant deactivates photosynthesis-derived reactive oxygen species (mainly 102 and OH), and preventhe propagation of lipid peroxidation, contribute to plant stress tolerance. B1 can assist at any time in a plant's life with root regeneration where the root system has been damaged or stressed throughigh salinity, pathogens such as pythium, nutrient deficiencies and toxicities.
