

Nature's Source Naturally Derived Nutrition – Oilseed Extract

Nature's Source nutritional values are derived from proprietary blends of Seed Extracts, which alone are considered as valued byproducts of wet seed milling; seed is processed by steeping/leaching by a proprietary process. The principal products of wet seed milling are the starches, glutens, germs, and fibers from the seed, which are used for various food, feed, and industrial products. Our Seed Extract contains the soluble amino acids found in seed, and is therefore considered a rich source of nitrogen, plus a full gamut of macro and micronutrients

Additionally, our blended Seed Extracts are rich in lactic acid, vitamins and proteins; again alone seed extracts are mainly used in the pharmaceutical, animal feed and enzyme industry. The seed extracts are additionally used as additives in animal feed and as a cultural medium in antibiotic production. These same components are also vital and important to plant health and crop production.

Furthermore, since our Seed Extract sources are derived from oilseed, we also are able to deliver additional natural nutrition, such as natural organisms, cytokines, and gibberellins, which again aid in overall plant development and health.

Nature's Source Seed Extracts also provide a natural source of carbon, which feeds the soil creating a healthy environment for promoting and spawning natural organisms in the soil typically depleted by other nutrition technology such as synthetic / water soluble type fertilizers.

Finally, by extracting the oil phase of the seed/extract, we deliver natural wetting agents which is reflected in our product's characteristics; no mixing, easily disperses in water, and spreading/sticking/penetration characteristics when applied as a foliar spray/mist.
